APPROVED BY: C.F. Jick

C. F. PICKETT, Technical Director
U.S. Army Coating and Chemical Laboratory

ABSTRACT

The object of this test was to evaluate the high temperature field performance of an all-weather hydraulic brake fluid. This report covers the results of desert tests at Yuma Test Station, Arizona.

New brake cylinders were packaged with the all-weather brake fluid and installed on $\frac{1}{4}$ ton, 3/4 ton, $2\frac{1}{2}$ ton and 5 ton facility vehicles; all-weather fluid was placed in the brake systems; the vehicles were then placed in normal facility operation during the test period of 12 June 1962 to 25 February 1963.

The all-weather brake fluid performed satisfactorily in all vehicles throughout the test period.

1. INTRODUCTION

Aberdeen Proving Ground, Maryland, was requested by Research and Engineering Directorate, OTAC, ORDMC-RP.4, AUS-20 dated 29 November 1961, to conduct field tests on an all-weather brake fluid. This fluid had been developed by the Coating and Chemical Laboratory (CCL Report No. 115) and combined the essential high temperature requirements of Federal Specification VV-H-910a, Hydraulic Fluid, Non-Petroleum Base, Automotive and the low temperature requirements of Military Specification MIL-H-13910, Hydraulic Fluid, Non-Petroleum Base, Automotive Brake, Arctic.

Two phases of testing were outlined: (a) High temperature testing at Yuma Test Station, Arizona; (b) Arctic testing at Fort Wainwright, Alaska. This report covers results of the high temperature field tests at Yuma Test Station.

11. DETAILS OF TEST

A. Test Vehicles

Ten vehicles listed in Table I, Appendix B, were used in this test. These vehicles were facility vehicles in use at Yuma Test Station and consisted of $3 - \frac{1}{4}$ ton, $2 - \frac{3}{4}$ ton, $2 - \frac{2}{2}$ ton, and 3 - 5 ton vehicles.

B. Preparation of Vehicles for Test

All vehicles were prepared for test in accordance with Test Plan, Appendix A. One vehicle of each weight class was instrumented with thermocouples to measure brake fluid temperatures and air temperature in the vicinity of the cylinders. Thermocouples were Installed at the master cylinder and on one wheel cylinder per axle.

C. Inspection of Vehicles During Test Period

Fluid level was checked periodically. A history of fluid additions, miles of operation, operating conditions, brake malfunctions and climatic conditions was recorded. This test was in operation from 12 June 1962 until 25 February 1963. At the completion of the test all brake cylinders were removed from the vehicles and forwarded to the laboratory for examination and evaluation.

III. RESULTS OF TEST

A. Inspection of Cylinders

Results of cylinder inspection are included in Table 1, Appendix B. Test data supplied by field testing personnel included in Appendix C.

B. Fluid Additions

Fluid additions at the completion of the test were greater than anticipated. In many instances the presence of sand inside the cylinders caused leakage. Other causes of leakage not attributable to brake fluid

deficiency, included three faulty air-hydraulic cylinders, faulty threads on one cylinder assembly, one damaged washer seal, one loose line fitting at a master cylinder, and the presence of foreign materials inside four cylinders.

C. Gum Deposits and Corrosion

Cylinders returned to the laboratory from five of the vehicles had not been forwarded to the testing activity for this field test. These cylinders contained moderate to heavy amounts of gummy residue. Cylinders which had been forwarded for the test contained slight to moderate amounts of gummy residue. All cylinders were operational. No excessive corrosion was noted. Rubber cups showed slight scuffing, especially in cylinders containing sand.

D. Examination of Fluid

Results of tests run on fluid removed from cylinders are listed in Table II, Appendix B. The decrease in boiling point is normal and attributed to condensed moisture. All samples of fluid contained some sediment; this sediment was analyzed and found to be high in silicon content. This indicated that sand and dust had accumulated in the cylinders. Some organic material was also found.

E. Temperature Data

Temperature data are listed in Appendix C. No extreme temperature readings were encountered. Ambient temperature recorded on test runs ranged from 76°F. to 113°F. Air temperature in the vicinity of the cylinders reached 151°F. The highest fluid temperature recorded during the test was 145°F. This is well below the boiling point of the brake fluid.

F. Malfunctions Caused by Brake Fluid Failure

No serious brake malfunctions attributable to the test fluid occurred during the test period.

IV. DISCUSSION

The all-weather brake fluid performed satisfactorily in this field test. Leakage was not directly attributable to the fluid, but to mechanical failures and the presence of foreign material in the brake system.

The gum deposits in the cylinders did not hinder brake operation during the test period. These deposits, however, could lead to future difficulties. A dimer acid inhibitor was included in the brake fluid formulation used in this test. It is believed that this dimer could have caused part of the gum deposits which were found. Tests are being conducted on a modification of the brake fluid formulation in which the dimer has been eliminated.

Several of the cylinders used in this test had not been packaged for the test. Available history on the cylinders indicated that they had been packaged with brake fluid almost a year before installation in the test vehicles. Brake fluids generally are not good packaging fluids; this would account for some of the gum deposits found in these cylinders at the end of the test.

The fact that the major portion of the test was conducted during the winter months and lack of temperature data during the final few months of the test minimized the value of the test. However, since no operational malfunctions occurred, it was concluded that the brake fluid would be satisfactory in desert operation.

V. RECOMMENDATION

Based on this field test and Arctic field tests which have been completed it is recommended that the all-weather fluid be adopted for military usage.

It is further recommended that formulations which do not include the dimer acid be laboratory and field evaluated.

APPENDIX A

Test Plan

TEST PLAN

DESERT TESTING

1. Vehicles employed shall consist of the following facility vehicles at Yuma Test Activity, Yuma Test Station:

3 ea $\frac{1}{2}$ -ton M38A1 2 ea 3/4-ton M37 1 ea $2\frac{1}{2}$ -ton M108 1 ea $2\frac{1}{2}$ -ton M220 2 ea 5-ton M62 1 ea 5-ton M52

- 2. Brake fluid shall be removed from the system of each vehicle. Filtered compressed air shall be used to remove all existing fluid from lines. All brake cylinders (master and wheel) shall be removed and new cylinders installed. (New cylinders will be supplied by the Coating & Chemical Laboratory).
- 3. The brake system will be filled with the all-weather fluid, which will be supplied by the Coating & Chemical Laboratory. Brakes shall be adjusted for proper brake action.
- 4. A counter shall be installed for measuring brake applications.
- 5. Thermocouples shall be installed in positions to get brake fluid temperatures and air flow characteristics around the drums and brake wheel cylinders.
- 6. Vehicle shall be tagged stating that a brake test is in progress.
- 7. During the regular maintenance check-ups the fluid level in the master cylinder will be checked. Only test fluid will be added, and amounts recorded.
- 8. Memorandum reports shall be submitted to the Coating & Chemical Laboratory after 3 and 6 months. These reports shall include temperature data, miles of operation, number of brake applications, maintenance data, general road and terrain conditions and pertinent brake data.
- 9. After 6 months of service all brake fluid and brake cylinders shall be removed from the vehicles and forwarded to the Coating & Chemical Laboratory for inspection; evaluation, and analysis.

DF, ORDBG-DPS-DF, dtd, 6 Jun 62, Incl. No. 2

INTRODUCTION

Wheel cylinders and master cylinders provided by Coating and Chemical Laboratory were installed on one 1/4 ton truck, one 3/4 ton truck, two 2 1/2 ton trucks, and one 5 ton truck.

The brake system of each vehicle was filled with test brake fluid.

One vehicle of each weight class was instrumented with thermocouples to measure brake fluid temperature, brake cylinder skin temperature, and air temperature in the vicinity of the cylinder. The thermocouples were installed at the master cylinder and one wheel cylinder per axle.

Counters were installed on the above vehicles, and two other vehicles which will be equipped with test brakes, to measure the number of brake applications.

The vehicles were returned to normal facility service when the installations were completed.

Brake cylinders are being installed on 5 remaining facility vehicles.

RESULTS

The following table presents the mileages accumulated and the number of brake applications recorded.

The information contained in this report is tentative and should be so treated.

ORDEG-TA-ET-AU

TITLE: First Mannerardum Report on Summer Test (1962) of All Weather

Brake Fluid, CMS 5010.11.80200.02

TABLE I

Yehicle	USA Reg. No.	Miles	Number of Brake Applications
Truck, Utility, 1/4 Ton, 4x4, M38Al	20977124	419	2181
Truck, Cargo, 3/4 Ton, 4x4, M37	2443415	14	42
Truck, Van, 2 1/2 Ton, 6x6, M220	4A4212	12	35
Truck, Wrecker, 2 1/2 Ton, 6x6, M108	4A1883	248	624
Truck, Tractor, 5 Ton, 6x6, M52	5156241	147	493

Temperature data taken on Truck, Utility, 1/4 Ton, 4x4, M38A1, USA Reg. No. 20977124 are included as Inclosure 1 and Inclosure 2.

Maintenance was performed on the brake system of Truck, Wrecker, 2 1/2 Ton, 6x6, M108 after 192 miles of operation. There was a leak in the air pack due to a defective gasket. The gasket (FSN 2530-753-9337) was replaced.

The mileage on the vehicles was accumulated on paved and secondary roads. The majority of the operation was on level terrain with occasional trips on hilly terrain.

FUTURE WORK

The remaining test master cylinders and wheel cylinders will be installed in two Trucks, Utility, 1/4 Ton, 4x4, M38Al, one Truck, Cargo, 3/4 Ton, 4x4, M37, and two Truck, Tractor, 5 Ton, 6x6, M62, and counters will be installed in the remaining one Truck, Cargo, 3/4 Ton, 4x4, M37 and one Truck, Tractor, 5 Ton, 6x6, M62.

Brake application counters will be installed in one each M37 and M62. Temperature data and brake application data will be taken.

HEADQUARTERS YUIN TEST STATION YUIN, ARIZONA

W. O. No.: 7200 MBohi/pjh/2000

Refer to:

STEYT-TOE

TITLE: Third Memorandum Report on Summer Test (1962) of All Weather

Brake Fluid, ANCIE 5010.11.80200.02

TO: Commanding Officer, Aberdeen Proving Ground, Aberdeen, Maryland, ATTN: CTEAP-DS-DF

Reporting Period: 2 October 1962 to 17 December 1962

INTRODUCTION

Tests have been completed on the MBSAl truck, USA Reg. No. 20977124, M52 truck, USA Reg. No. 5156241, and MBOS truck, USA Reg. No. 4A1883. The brake parts from these vehicles will be removed and returned to Coating and Chemical Laboratory.

RESULTS

The following table presents the mileages accumulated and the number of brake applications recorded to date.

Table I. Mileage and Brake Applications

Vehicle	No.	Miles	lo. of Brake
Truck, Utility, 1/4-ton, 4x4, 138Al Truck, Utility, 1/4-ton, 4x4, 138Al Truck, Utility, 1/4-ton, 4x4, 137 Truck, Cargo, 3/4-ton, 4x4, 137 Truck, Cargo, 3/4-ton, 4x4, 137 Truck, Wrecker, 2-1/2 ton, 6x6, 1108 Truck, Wan, 2-1/2 ton, 6x6, 1220 Truck, Tractor, 5-ton, 6x6, 152 Truck, Wrecker, 5-ton, 6x6, 152 Truck, Wrecker, 5-ton, 6x6, 152 Truck, Wrecker, 5-ton, 6x6, 152	20977124 20975730 219096 315757 2443415 411883 411883 4112 5156241 54135	2718 1748 1265 2605 1656 2402 2794 1770 1273 1056	9500 9315 5735 7930 5266 4924 2974 3537 4838

Temperature data were taken on M108 truck, USA Reg. No. 4A1883, M52 truck, USA Reg. No. 5156241, and M37 truck, USA Reg. No. 2443415, and are presented in Inclosures 1, 2, 3, and 4, respectively.

STEYT-TOE

TITLE: Third Monorandum Report on Summer Test (1962) of All Weather Brake Fluid, ANCHS 5010.11.80200.02/7200

The mileage on the vehicles was accumulated on paved and secondary roads. The majority of the operation was on level terrain with occassional trips on hilly terrain.

Two brake malfunctions occurred during this period (Inel 5 and 6).

FUTURE WORK

Future work will include the collection of brake application data for the remaining vehicles. These brake parts will be removed at the end of the test, and returned to Coating and Chemical Laboratory.

SUBMITTED:

APPROVED:

KENNETH H. BOHI Test Director

IAN C. FORREST Acting Chief, Mobility Branch

The information contained in this report is tentative and should be so treated.

TTTLE: Fourth and Final Memorandum Report on Summer Test (1962) of All Weather Brake Fluid

TO: Commanding Officer, Aberdeen Proving Ground, Aberdeen, Maryland, ATTN: STEAP-DS-DF

Reporting Period: 18 December 1962 through 25 February 1963

INTRODUCTION

Test operations have been completed with the brake fluid and brake components on all the vehicles. All the parts have been removed and turned in to supply for shipment to the Coating and Chemical Laboratory.

RESULTS

The following table presents the final mileages accumulated and the number of brake applications recorded.

Table 1. Mileage and Brake Applications

Vehicle	USA Reg No.	Miles	No. of Brake Applications
Truck, utility, 1/4-ton, 4x4, M38Al Truck, utility, 1/4-ton, 4x4, M38Al Truck, utility, 1/4-ton, 4x4, M38Al Truck, cargo, 3/4-ton, 4x4, M37 Truck, cargo, 3/4-ton, 4x4, M37 Truck, wrecker, 2-1/2 ton, 6x6, M108 Truck, van, 2-1/2-ton, 6x6, M220 Truck, tractor, 5-ton, 6x6, M52 Truck, wrecker, 5-ton, 6x6, M62 Truck, wrecker, 5-ton, 6x6, M62	20977124	2718	9500
	20975780	2314	12788
	2A9096	1458	7401

	2443415	2131	7028
	4A1883	2402	4924
	4A4212	3064	3379
	5156241	1770	3537
	54L35	1896	6800
	00120342	1130	2089

All of the vehicles are facility type vehicles that receive normal usage on paved and secondary roads.

The information contained in this report is tentative and should be so treated.

STEYT-TOE

TITLE: Fourth and Final Memorandum Report on Summer Test (1962) of All Weather Brake Fluid, Project No. 593-21-061

Maintenance performed on the brake systems during the complete test was as follows:

28 May 1962, USA Reg No. 4A1883, mileage 0

Received master cylinder with damaged plunger seal. The seal was replaced and the master cylinder installed in the vehicle.

28 May 1962, USA Reg No. 5156241, mileage 0

Received master cylinder with bracket broken off. Replaced master cylinder with another one.

3 July 1962, USA Reg No. 4A1883, mileage 169

Brake application was soft and spongy. Removed and inspected hydropack and found leak in air hydraulic brakes. Replaced gasket (FSN-2530-753-9337), inlet and exhaust valve cage and cap.

30 July 1962, USA Reg No. 4A4212, mileage 380

The brakes were inoperative because of a lack of fluid. A faulty thread on the plate (ORD No. EX375911) allowed aluminum filings into the fluid chambers. These filings disrupted the action allowing brake fluid into the air side of the air hydraulic cylinder assembly was replaced.

24 August 1962, USA Reg No. 5156241, mileage 763

Brakes were reported soft and spongy. Found brake fluid level low and added 600 ml of brake fluid to master cylinder. Bled master cylinder and air pack unit and checked wheel cylinder adjustment.

24 September 1962, USA Reg No. 4A1883, mileage 1649

Added 377 ml of brake fluid to master cylinder to bring the brake fluid to correct level. Removed old air pack and installed new pack (FSN-2530-040-2188). Returned vehicle to service.

STEYT-TOE

TITLE: Fourth and Final Memorandum Report on Summer Test (1962) of All Weather Brake Fluid, Project No. 593-21-061

23 October 1962, USA Reg No. 3B5757, mileage 951

Filled master cylinder with 400 ml of brake fluid. Bled lines and check wheel adjustments. Tightened fitting on line in front of the master cylinder.

12 December 1962, USA Reg No. 2443415, mileage 1664

Brakes were reported spongy. Replaced a washer seal on right front wheel. Added 200 ml of brake fluid to the master cylinder.

14 December 1962, USA Reg No. 5156241, mileage 1770

Added 400 ml of brake fluid to master cylinder. When removing test components at the conclusion of test, the right front cylinder, right intermediate cylinder, and the left rear cylinder were all found to be leaking with foreign material visible in the cylinders.

17 December 1962, USA Reg No. 20977124, mileage 2723

When removing test parts at end of test, the right rear cylinder was found to be leaking past the cup with foreign material visible in the cylinder.

8 January 1963, USA Reg No. 00120342, mileage 1059

Brakes were reported to be soft and spongy. Added 250 ml of brake fluid to the master cylinder and bled the lines.

7 January 1963, USA Reg No. 54L35, mileage 1272

Brakes not operating correctly. Added 450 ml of brake fluid to the brake cylinder but found no leaks or troubles in the cylinders or the lines.

18 January 1963, USA Reg No: 4A4212, mileage 3064

Test brake fluid was removed from brake system by mistake and standard fluid added. The test cylinders were removed and cleaned with compressed air and will be shipped to the Coating and Chemical Laboratory dry.

30 January 1963, USA Reg No. 2A9096, mileage 1458

Added 450 ml of brake fluid to the master cylinder before removing the vehicle from the test. Found no leaks or trouble.

STEYT-TOE

TITLE: Fourth and Final Memorandum Report on Summer Test (1962) of All Weather Brake Fluid, Project No. 593-21-061

1 February 1963, USA Reg No. 2443415, mileage 2131

Added 40 ml of test brake fluid to the master cylinder. Found both cups of right rear cylinder and right front cylinder leaking slightly.

7 February 1963, USA Reg No. 3B5757, mileage 2787

Added 280 ml of brake fluid to the master cylinder before removing test parts. Also found the four wheel cylindere to be leaking.

12 February 1963, USA Reg No. 20975780, mileage 2314

Added 80 ml of test brake fluid to the master cylinder before removing test brakes. Also found the left rear and right front wheel cylinders leaking slightly and the left front cylinder leaking heavily.

15 February 1963, USA Reg No. 00120342, mileage 1130

Added 270 ml of test brake fluid to the master cylinder before removing test brakes. Also found the right intermediate and the right rear cylinder leaking slightly with some foreign material visible in the cylinders.

25 February 1963, USA Reg No. 54L35, mileage 1896

Added 280 ml of test brake fluid to the master cylinder to bring to correct level. Also found left front cylinder cups leaking before the test cylinders were removed from the vehicle.

No breke malfunction occurred during this period.
